Glucopyranoside

Glucopyranosides of aglycons (other than nitrogen heterocycles) that contain no function higher than hydroxyl are indexed at this heading, stereochemical information, if known, being included in the index compound name; e.g., α -D-Glucopyranoside, methyl. Otherwise the compound is entered at the name of the index parent which contains the higher function. Thus, tilianin (acacetin 7- β -D-glucopyranoside) is indexed at the systematic name of the flavonoid aglycon, acacetin, with replacement of the 7-hydroxy substituent by the sugar radical: 4H-1-Benzopyran-4-one, 7-(β -D-glucopyranosyloxy)-5-hydroxy-2-(4-methoxyphenyl)-. Glucopyranosyl derivatives attached directly, or through oxygen, chalcogen, or amino, to the nitrogen atoms of heterocycles are indexed at the heterocycle names. Glucopyranosyl derivatives attached to carbocyclic rings or to carbon atoms of heterocycles are indexed at the heading parent names that express the higher functions. Examples: 9H-Purine, 9- β -D-glucopyranosyl-, 3-Pyridinecarbonitrile, 6-(α -D-glucopyranosyloxy)-; β -D-Glucopyranoside, 3-hydroxy-1H-indol-2-yl. Glucopyranosides
